

Subject Description Form

Subject Code	CSE392
Subject Title	Quantitative Methods for EOSH
Credit Value	3
Level	3
Pre-requisite	Nil
Exclusion	CSE372 / CSE38300 / CSE38900 / CSE39284
Objectives	To provide the basic tools of mathematics and fundamental concepts to enable the students to formulate problems in statistical terms in civil engineering, sustainable development and occupational safety and health, and to apply statistical tools for their interpretation of data.
Intended Learning Outcomes	<p>Upon completion of the subject, students will be able to:</p> <ol style="list-style-type: none"> a. summarize and present information effectively from data; b. apply the fundamentals of mathematics and science to formulate problems and obtain cost-effective solutions in civil engineering, sustainable development and occupational safety and health; c. design and carry out proper statistical tests and interpret the results for evaluation of problems in civil engineering, sustainable development and occupational safety and health; d. appreciate probabilistic nature of engineering/scientific problems and develop ability to quantify risk; e. integrate knowledge across different subject domains, including environmental science, engineering, and occupational safety and health when trying to achieve objectives; f. communicate solutions logically and lucidly through calculation, sketch, drawing and in writing.
Subject Synopsis/ Indicative Syllabus	<ol style="list-style-type: none"> 1. Techniques for analysis of experimental data, field data and meteorological data: first moment and second moment, locations and spread, outliers, scatter plots, box plots, frequency distribution and sample size required. Distributions of experimental results, measured data and meteorological data: normal distribution, lognormal distribution, Weibull distribution. Sampling distribution and estimators. Goodness-of-fit test. Correlation and regression analysis, coefficients and

	<p>residuals. Correlation between collected data: regression models, coefficient of determination, prediction intervals. General linear model, multiple regression. ANOVA applied to regression. Identification of long term trend and contributing factors.</p> <p>2. Hypothesis testing and tests of significance. p values, power of a test. Mean exceeding standards. Implications of change of mean and standard deviation with time. Inference of two populations. Comparison of environmental quality at different time and different locations, t-test. Inference of more than two populations. One-way ANOVA. Two-way ANOVA. Randomized block. Chi square test. Checking normality of data. Contingency table.</p>																																						
<p>Teaching/Learning Methodology</p>	<p>Emphasis is placed on a pro-active learning approach. Fundamental knowledge will be introduced in the lectures, with interspersed questions, exercises and quizzes for class discussion and after class self study. Students will be expected to read up, do exercises and reflect critically on the material covered in class. A companion web site-cum-discussion forum will be available to facilitate questioning and discussion. Optional tutorial sessions (1 hour per alternative week) can be arranged to cater for diverse learning needs on request.</p>																																						
<p>Assessment Methods in Alignment with Intended Learning Outcomes</p>	<table border="1" data-bbox="516 1150 1365 1514"> <thead> <tr> <th rowspan="2">Specific assessment methods/tasks</th> <th rowspan="2">% weighting</th> <th colspan="6">Intended subject learning outcomes to be assessed (Please tick as appropriate)</th> </tr> <tr> <th>a</th> <th>b</th> <th>c</th> <th>d</th> <th>e</th> <th>f</th> </tr> </thead> <tbody> <tr> <td>1.
